The new ECMWF Seasonal fc. system (Sys-4)

ECMWF System 4: main features (1)

- **New ocean model : NEMO v. 3.0 + 3.1 coupling interface**
 - ORCA-1 configuration (~ 1 -deg. resol., ~ 0.3 lat. near the equator)
 - 42 vertical levels, 20 levels with $z < 300$ m
- **Variational ocean data assimilation (NEMOVAR)**
 - 3-D var with inner and outer loop
 - Collaboration with CERFACS, UK Met Office, INRIA
 - First re-analysis (1957-2009), no assim. of sea-level anomalies
 - Final re-analysis (ORA-S4) and real-time system including SLA
- **IFS model cycle: 36r4** (op. Nov. 2010-May 2011), **T255-L91**
 - New physics package, including H-TESSEL land-surface scheme, new snow model, new land surface initialization
- **Prescribed sea-ice conc. with sampling from recent years**

ECMWF System 4: main features (2)

- **Operational forecasts**

- 51-member ensemble from 1st day of the month
- released on the 8th
- 7-month integration

- **Experimental ENSO outlook**

- 13-month extension from 1st Feb/May/Aug/Nov
- 15-member ensemble

- **Re-forecast set**

- 30 years, start dates from 1 Jan 1981 to 1 Dec 2010
- 15-member ensembles, 7-month integrations
- 13-month extension from 1st Feb/May/Aug/Nov

Skill scores and 95% conf. intervals (1000 samples)
Brier skill score: 0.092 (0.007, 0.162)
Reliability skill score: 0.986 (0.950, 0.994)
Resolution skill score: 0.106 (0.056, 0.173)

Sys3

Reliability diagram for ECMWF with 11 ensemble members
Near-surface air temperature anomalies above the upper tercile
Accumulated over Europe (land and sea points)
Hindcast period 1981-2010 with start in May average over months 2 to 4
Skill scores and 95% conf. intervals (1000 samples)
Brier skill score: 0.031 (-0.045, 0.094)
Reliability skill score: 0.943 (0.891, 0.965)
Resolution skill score: 0.089 (0.056, 0.133)

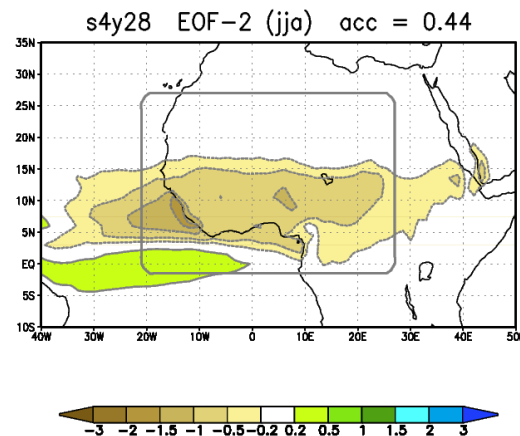

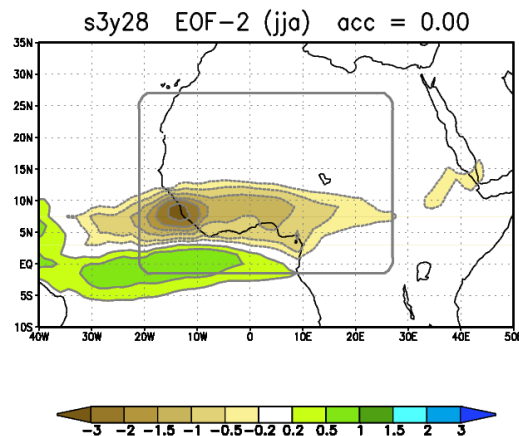

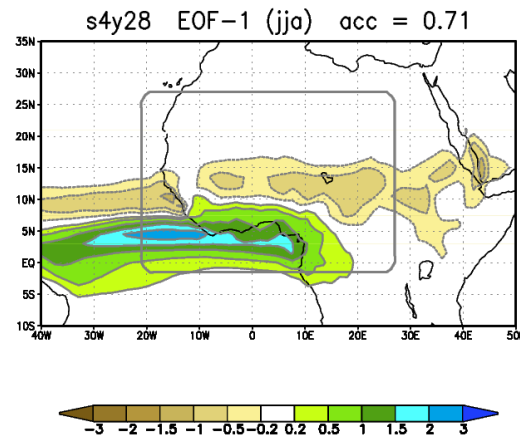

Decadal variability in ocean heat content from ORA-S4

Variability of tropical rainfall: EOF comparison

Actual vs. perfect-model skill: rainfall PC-1

S4 PC-1 correlation (GPCP vs perfect model)

S3 PC-1 correlation (GPCP vs perfect model)

Prediction of tropical cyclone frequency: NW Pacific

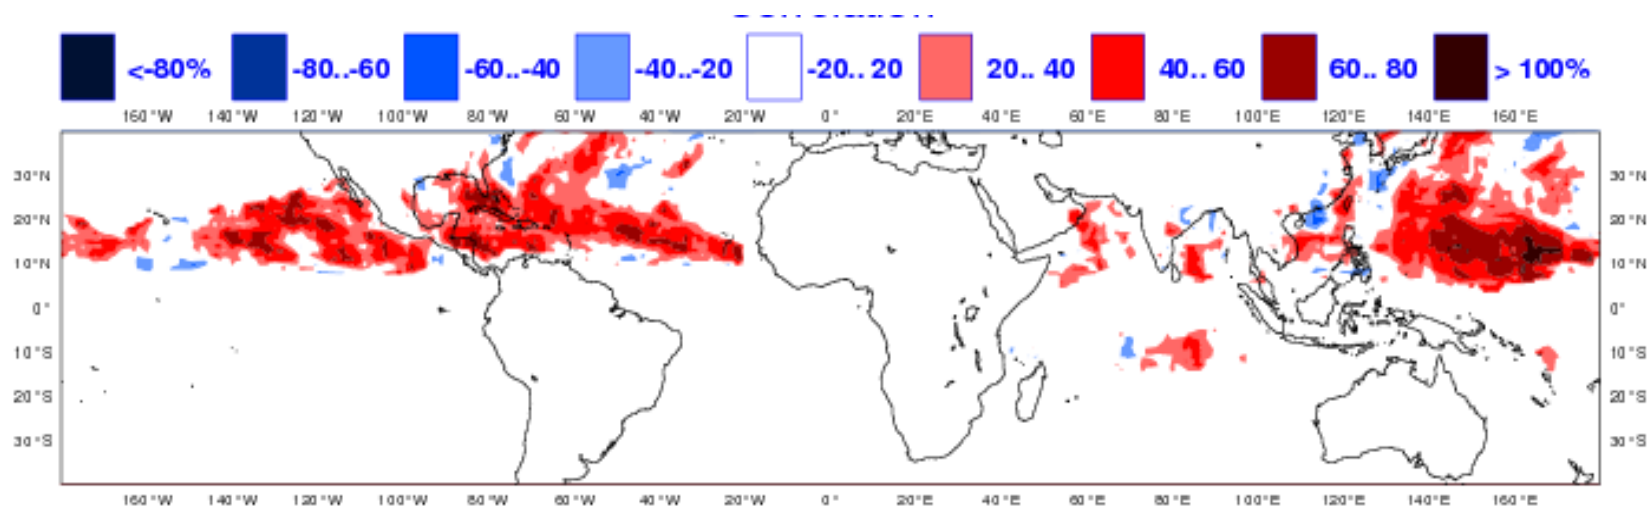

System 4

System 3

Verification (ACC) of cyclone track density in S4

Conclusions

- ECMWF has developed a new seasonal fc. system (Sys-4) based on an IFS-NEMO coupled model and a 3-D var. ocean data assimilation (NEMOVAR) , with higher spatial resolution and an extended re-forecast set.
- The IFS-NEMO coupled model shows reduced extra-tropical biases, but is affected by too strong easterlies and a cold SST bias in the Equat. Pacific cold tongue. ENSO variability is over-estimated, with max at fc. month 3-4.
- SST forecast skill is similar to Sys-3 in the NINO regions (better in NINO3, slightly worse in NINO4), increased in the tropical and sub-trop. Atlantic, but degraded over the West Pacific at long lead times.
- Spatial averages of ensemble-mean scores for atmospheric variables are higher than in Sys-3 at all seasons (NH summer better than winter).
- Tropical atmospheric variability is better simulated; this shows in more realistic patterns of rainfall variability and better simulation of the interannual and decadal variation in tropical cyclone frequency.
- The enhanced internal variability and better match between spread and error lead to more reliable forecasts in the seasonal range, even when deterministic scores are not significantly improved w.r.t. Sys-3.

Beyond System 4

- Higher resolution ocean model (NEMO 0.5/0.25 deg., L75)
- Dynamical sea-ice model (LIM-2 or LIM-3)
- Better initialization and perturbation of land-surface variables
- Improved representation of stratospheric processes and forcings
- Revised coupling strategy to improve code efficiency with high-resolution ocean model
- Closer connection between atmospheric and oceanic ensemble data assimilation
